

DISPLAYNAME AND RESOURCE IDENTIFIER SYNCHRONIZATION

ABSTRACT OF THE DISCLOSURE

Methods and apparatus, including computer systems and program products synchronizing a displayname and a resource identifier. In one technique, a machine-implemented method includes receiving input corresponding to a displayname of a data resource; preparing a resource identifier of the data resource within a repository based on the input and naming conventions associated with the repository; and preparing the displayname of the data resource based on the input. The resource identifier may be prepared such that the resource identifier resembles the displayname. Naming conventions may include a naming convention that requires a content-type extension to be retained by a resource identifier. The displayname may be presented to a user interface such that only the displayname is displayed and a corresponding resource identifier is excluded from being displayed.
